

1.5" Probe Assembly

with Solid State Control

Product code: BW1615

Instructions:

- The probes can be cut down to custom lengths as needed for proper operation.
- Your farm technician can use a saw to carefully cut them down and then file or sand paper the cut end to remove burrs.
- Bending them back and forth is not recommended.
- The probes should only be cut at the exposed tapered ends.
- They are epoxy filled so they will remain sealed after cutting them.
- Keep in mind that the longest probe must remain the longest and can be cut just above the bottom of the jar at the height they wish the pump to activate.
- The middle length probe can be cut approximately 1 inch shorter than the longest. It is suggested that they measure how much shorter the middle probe is than the longest probe and make the cut to that same amount.
- The shortest probe can be cut at the length they desire the pump to activate.
